⚠ Source Data Disclaimer:

NYC TLC documentation notes discrepancies in Lyft shared ride match/request flag values within the original dataset. Uber data is unaffected.

Shared Trips by Zone

Week Day Trend by Hour

Week End Trend by Hour

KEY INSIGHTS - Q1 2026 Based on NYC TLC Public Dataset Analysis

Market Structure

Uber dominates with 71% market share (45M trips)

Lyft holds 29% market share (18M trips)

2.5x volume gap between the two platforms

Both platforms show JFK and LaGuardia as top revenue zones

Service Quality Difference

Lyft performs better: 6% SLA breach rate, 4.46 min avg wait time

Uber shows: 9% SLA breach rate, 4.73 min avg wait time

Despite smaller fleet size, Lyft demonstrates better operational efficiency

Combined 8% SLA breach = approximately 5M trips with poor service demand

Economic Model (Estimated from Public Data)

Driver compensation: 62.5% of gross bookings goes to drivers

Estimated platform margins: ~23% for both providers

Peak Demand Failures

Weekday mornings (7-9 AM): Wait times spike to 6+ minutes

Weekend late nights (10 PM onwards): Wait times climb past 6 minutes

These two windows drive majority of SLA breaches

Supply gaps persist despite high trip volumes

Shared Ride Inefficiency

Shared ride requests consistently exceed successful matches

Pattern appears across all major zones: LaGuardia, JFK, Crown Heights

Indicates matching algorithm issue, not lack of demand

Note:

Lyft shared ride data contains known discrepancies per TLC document

KEY INSIGHTS - Q1 2026 Based on NYC TLC Public Dataset Analysis

Recommendation

Target Driver Incentives at Specific Time Windows

Action: Shift driver bonuses exclusively to 7-9 AM weekdays and 10 PM+ Weekends

Expected Impact: Reduce SLA breach rate from 8%

Reason: Blanket incentives waste resources; peak windows need focused supply

Improve Shared Ride Matching Algorithm

Action: Investigate and fix the request-to-match conversion gap

Expected Impact: Increase revenue per driver route without adding trip volume

Reason: Demand signal is strong; matching logic is the bottleneck

Diversify Revenue Beyond Airport Zones

Action: Develop pricing/incentive strategy for mid-borough zones (Crown Heights, East Village)

Expected Impact: Reduce concentration risk if TLC restricts airport access

Reason: Over-reliance on JFK + LaGuardia creates regulatory vulnerability

Quantify Cost of SLA Breaches

Action: Calculate customer churn rate, refunds, and rating impact of 5M breached trips

Expected Impact: Build data-driven business case for supply investments

Reason: Without cost quantification, operational improvements lack urgency
